

ZKTrustLLM-Agents L4 Automation Governance Dashboard

Steps 96-98 Closed-Loop Automation Summary

Generated: 2026-05-09T18:01:26

1. Purpose

This report documents the governance boundary and scientific meaning of the current Level 4 automation workflow. It connects the agentic automation suite, KPI decision agent, and remediation executor into a single supervisor-readable view.

2. Closed-Loop Automation Chain

Step	Component	Status / Decision	Meaning
96	Agentic automation suite	PASS	Runs L4 experiments
97	KPI decision agent	GENERATE_SUPERVISOR_REPORT	Recommends next action
98	Remediation executor	EXECUTED_PASS	Executes approved plan

3. Governance Boundary

Allowed without privileged execution

- read KPI JSON and CSV artifacts
- validate experiment outputs
- generate Markdown reports
- generate PDF reports
- create artifact manifests
- recommend next safe workflow action

Allowed only with human approval

- execute remediation workflow
- regenerate supervisor PDF
- rerun non-privileged experiments
- rerun privileged network experiments with explicit sudo approval

Never automatic

- git push
- modify Git history
- submit papers
- email supervisor
- deploy public systems
- delete research evidence
- run privileged commands without explicit approval

4. Supervisor Progress Interpretation

The project has now reached a meaningful closed-loop automation milestone. Step 96 executes the L4 workflow, Step 97 evaluates KPI evidence and recommends a next action, and Step 98 executes only safe approved remediation. This demonstrates a controlled form of agentic research automation.

5. Next Milestone: Step 100

The next milestone should implement a policy-gated autonomous scheduler. The scheduler should run in dry-run mode by default, use approval gates for privileged or irreversible actions, preserve audit logs, and generate rollback notes.
